Introduction

Brook Crompton a company of ATB group

Brook Crompton is a leading manufacturer of electric motors for the global industrial market, with motor solutions which benefit a wide range of customers.

Throughout the branch, new ATB developments and systems solutions are regarded as intelligent. This means that they are efficient, individually manufactured, extremely economic and underpinned by close co-operation with customers. Many years of experience and the know-how of the work force have been merged and play a fundamental role in product intelligence. In addition, the Group also provides on-site system integration, in order to guarantee customers optimum advantages from ATB solutions.

ATB also demonstrates flexibility in the production area.

Quality assurance

ATB is a name for quality production. For standards that are maintained by means of continuous investment in modern production systems such as resin impregnation plants, CNC processing centres, assembly robots and winding centres.

Efficiency is further raised by on-going improvements to the material flow and layout design.

Stringent quality procedures are observed from first design to finished product in accordance with the ISO9001:2008 documented quality systems.

Our factories have been assessed to meet these requirements, a further assurance that only the highest possible standards of quality are accepted.

Specification, standards and regulations

New legal regulations

In connection with the international discussion on energy efficiency, a world-wide harmonized energy efficiency classification system has been established for low-voltage three-phase asynchronous motors.

New international efficiency classes of motors: (IE = international Efficiency)

The new IEC60034-30:2009 defines world-wide the following efficiency classes in the power range from 0,75kW to 375kW 2p, 4p and 6p motors.

IE1 – Standard Efficiency (equivalent of EFF2)

IE2 – High Efficiency (equivalent of EFF1)

IE3 – Premium Efficiency

IE4 – Super Premium Efficiency

The efficiency factor defines the efficiency of motors when transforming electrical into mechanical energy. The higher the energy efficiency class, the more complex the production of motors becomes and the more material e.g. Copper, has to be used, which results in correspondingly higher prices. However, in relation to the economic life-time, the price impact by only a few percent and the additional cost will be amortized by the savings in energy costs in a short time.

A new method for determining efficiency

From now on, motors can be offered and sold with the new classes IE1, IE2 and IE3. In that case, the efficiency has to be determined according to the new measuring standard EN60034-2-1:2007.

The new method leads to substantially increased accuracy under exactly defined laboratory condition. When comparing the measurements of the same motor, it is expected that the energy efficiency level measured with the new method will be a few percentage points less than the efficiency levels defined by the old method.

There are a few different method of determining the efficiency with low medium and high uncertainty.

For IE1 (standard efficiency) and motors below standard efficiency, test associated with low and medium uncertainty are acceptable. For higher efficiency levels only methods associated with low uncertainty shall be acceptable.

The methods for determining the efficiency are based on number of assumptions and it is not possible to make a comparison between the values of efficiency obtained by different methods. Therefore the motor documentation must state which method was used.

Under the new standard Brook Crompton uses indirect calculation method, additional load losses determined from measuring.

Climate protection

Today's energy trends and drivers:

- EU targets for increased energy efficiency:
 - 20% CO₂ emission
 - +20% energy efficiency
 - 20% the proportion of renewable energy
- Increased industrial efficiency through process optimization
- Limited availability of primary energy resources such as oil, gas, coal
- Higher financial cost of energy resources such as oil, gas, coal
- Globalization in the context of energy and the environment

The Brook Crompton high efficiency motor design has been optimized for application like compressors, pumps, cranes, lifts, fans and gearboxes. In these sectors customers can find the biggest potential for energy and cost savings.

Motor System Energy by Application

Specification

Enclosure

All motors are totally enclosed with a minimum ingress protection of IP55 as defined in IEC 60034-5 (BS EN 60034 part 5).

Higher IP protection can be supplied for special request.

Motor cooling

Motors are cooled in accordance with EN 60034-6. The normal arrangement is IC411 (Totally Enclosed Fan Ventilated) via a fan mounted at the non-drive end. Alternative methods of cooling available on request.

Insulation and thermal rating

Standard motors will operate satisfactorily in an ambient temperature range of -30°C to +40°C (Class B temperature rise) and altitudes up to 1000 metres above sea level.

Duty cycle

All standard WU-DA motors are suitable for SI Duty as described in IEC 60034-1.

Electrical characteristics

All 'W' motors are wound for the 'Eurovoltage'. Motors up to and including 3kW are normally supplied 230/400V, 4kW and above supplied 400V and are suitable for ±10% tolerance in line with IEC60034-1 standard..

Standard compliance

Brook Crompton motors are of the totally enclosed, single or three phase squirrel cage type, built to comply with international IEC and EN standards. Motors conforming to other national and international specifications are also available on request.

Notes

- All dimensions in millimetres
- Drain holes are standard on frames 160-180 and on request for frames 80-132
- Cable entry can be arranged in any one of four positions at 90° intervals
- No eyebolts on frame sizes 80-90
- On frame sizes 80 the terminal box is offset towards the non-drive end
- Dimensions should not be used for installation purposes unless specially endorsed

Notes

- B5 mounted motors have suffix '-D' in the frame reference, eg WU-DA132MRX-D and B3/B5 mounted motors have suffix '-H' in the frame reference, eg WU-DA132MRX-H
- B14 mounted motors have suffix 'C' in the frame reference, eg WU-DA132MRX-C and B3/B14 mounted motors have suffix '-H' in the frame reference, eg WU-DA132MRX-H
- Pad mounted motors have suffix '-P' in the frame reference, eg WU-DA132MRX-P

Typical speed/current curve

Frame size 80 - 180

Typical speed/current curve

Frame size 200 - 355

Typical speed/torque curve

Frame size 80 - 180

Typical speed/torque curve

Frame size 200 - 355

Description

- I_A Starting current
- I_N Full load current
- M_A Starting torque or locked rotor torque
- M_S Pull up torque or run up torque
- M_k Pull out torque or breakdown torque
- M_N Full load torque

Torque/speed curves for specific motors can be supplied on request.

Performance figures are subject to IEC tolerance. Performance figures are based on a 400 volt winding.

To calculate I_N on special voltages, multiply the I_N at 400 volts by the following factors:

Voltage	220	346	365	420	440	500	550
Factor	1.82	1.16	1.1	0.95	0.91	0.80	0.73

Notes

During the run up period in Star, there must be an adequate excess of motor torque over the load torque. The change to delta must not occur until the motor is near the operating speed.

Motors are wound for either 230/400 volts or 400/690 volts.

Useful information

Motor Duty Types

IEC 60034-1 defines various duty types that describe how the load and motor output varies with time. The motor must undergo a load test without exceeding the temperature limits laid down in the specification.

S1 continuous duty

Operation at a constant load and long enough for thermal equilibrium to be reached.

N - Operation Rated Condition
T_{max} - Maximum Temperature Rise

S2 short time duty

Operation at constant load for a given time that is shorter than the time needed to reach thermal equilibrium, followed by a rest and de-energised period. The de-energisation period should be long enough to allow the motor to reach a temperature that does not deviate from the temperature of the cooling medium by 2K.

N - Operation Rated Condition
T_{max} - Maximum Temperature Rise

S3 intermittent duty

A sequence of identical duty cycles, where each cycle is in two parts, one at constant load and the other at rest and de-energised. In this type of duty the starting current has no significant effect on the temperature rise. The duty cycle is too short for thermal equilibrium to be reached.

N - Operation Rated Condition
R - At rest / De-energised
T_{max} - Maximum Temperature Rise

S4 intermittent duty with starting

A sequence of individual duty cycles, where each cycle consists of a start that is sufficiently long to have a significant effect on the motor temperature, a period of constant load and a period at rest and de-energised. In this type of duty the starting current is insignificant on the temperature rise. The duty cycles are too short for thermal equilibrium to be reached.

D - Starting
N - Operation Rated Condition
R - At rest / De-energised
T_{max} - Maximum Temperature Rise

S5 intermittent duty with electrical braking

A sequence of identical duty cycles, where each cycle consists of a start, a period at constant load followed by rapid electrical braking, and a rest and de-energised period. The duty cycle is too short for thermal equilibrium to be reached.

D - Starting
N - Operation Rated Condition
F - Electrical Braking
R - At rest / De-energised
T_{max} - Maximum Temperature Rise

S6 continuous operation periodic duty

A sequence of identical duty cycles, where each cycle is in two parts, one at constant load and the other at no load, no rest and no de-energised period. The duty cycles are too short for thermal equilibrium conditions to be reached.

N - Operation Rated Condition
V - Operation at No Load
T_{max} - Maximum Temperature Rise

IP Rating

1st Digit	Protection from solid objects	2nd Digit	Protection from moisture
0	No special protection	0	No special protection
1	Protection from a large part of the body such as a hand, from solid objects greater than 50mm in diameter.	1	Protection from dripping water.
2	Protection against fingers or other object not greater than 80mm in length and 12mm in diameter.	2	Protection from vertically dripping water.
3	Protection from entry by tools, wires, etc., with a diameter of thickness greater than 2.5mm.	3	Protection from water sprayed at an angle up to 60° from the vertical .
4	Protection from entry by solid objects with a diameter or thickness greater than 1.0mm	4	Protection from water splashed from any direction.
5	Protection from the amount of dust that would interfere with the operation of the equipment.	5	Protection from water projected from a nozzle from any direction.
6	Dust tight.	6	Protection against heavy seas, or water from temporary flooding.
		7	Protection against immersion.
		8	Protection against complete, continuous submersion in water.

IEC/EN 60034-5 and EN 60529 outlines an international classification system for the sealing effectiveness of enclosures of electrical equipment against the intrusion into the equipment of foreign bodies (i.e. tools, dust, fingers) and moisture. This classification system utilizes the letters "IP" ("Ingress Protection") followed by two or three digits. (A third digit is sometimes used. An "X" is used for one of the digits if there is only one class of protection; i.e. IPX4 which addresses moisture resistance only.)

Degrees of Protection - First Digit

The first digit of the IP code indicates the degree that persons are protected against contact with moving parts (other than smooth rotating shafts, etc.) and the degree that equipment is protected against solid foreign bodies intruding into an enclosure.

Degrees of Protection - Second Digit

The second digit indicates the degree of protection of the equipment inside the enclosure against the harmful entry of various forms of moisture (e.g. dripping, spraying, submersion, etc.)
